# Introduction

In-progress book about algorithms and data structures.

# Algorithm Analysis

### 2.1 Amortized Analysis

The motivation for amortized analysis is that looking at the worst-case run time can be too pessimistic. Instead, amortized analysis averages the running times of operations in a sequence over that sequence. Amortized analysis is a useful tool that complements other techniques such as worst-case and average-case analysis.

— https://en.wikipedia.org/wiki/Amortized\_analysis

Imagine a dynamic list backed by a fixed size array that doubles once capacity is reached and require n inserts into the new fixed size array.

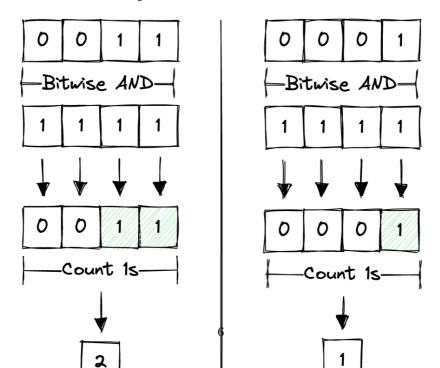

n	# of inserts
1	1
2	1
3	1
	1
$\mathbf{n}$	n
	n + 1

$$\frac{\text{\# of inserts}}{n} \to \frac{n+n+1}{n} \to \frac{2n+1}{n} \to \frac{2n}{n} \to 2$$

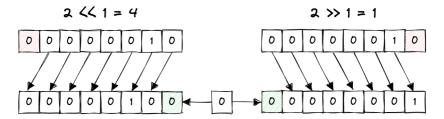

# Data Structures and Algorithms

#### 3.1 Bits

#### 3.1.1 Bit Parity

## 3.1.2 Bit Shift Operator

## 3.2 Stacks and Queues

#### 3.2.1 Fixed Stack

## 3.3 Graphs

# **Problem Solving Methods**

## 4.1 Greedy Algorithms

#### 4.1.1 Overview

A greedy algorithm is any algorithm that follows the problem-solving heuristic of making the locally optimal choice at each stage. In many problems, a greedy strategy does not produce an optimal solution, but a greedy heuristic can yield locally optimal solutions that approximate a globally optimal solution in a reasonable amount of time.

— https://en.wikipedia.org/wiki/Greedy\_algorithm

#### 4.1.2 Dijkstra's Shortest Path Algorithm

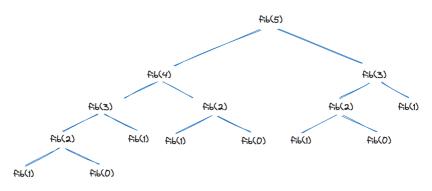

Dijkstra's shortest path algorithm is a search algorithm that finds the shortest path between a vertex and other vertices in a weighted graph.

#### 4.2 Recursion

The power of recursion evidently lies in the possibility of defining an infinite set of objects by a finite statement. In the same manner, an infinite number of computations can be described by a finite recursive program, even if this program contains no explicit repetitions.

#### 4.2.1 Fibonacci Sequence

$$F_0 = 0$$
  
 $F_1 = 1$   
 $F_n = F_{n-1} + F_{n-2}$  for  $n > 1$ 

```
\begin{split} F_n &= F_{n-1} + F_{n-2} \\ F_5 &= F_4 + F_3 \\ F_5 &= (F_3 + F_2) + (F_2 + F_1) \\ F_5 &= ((F_2 + F_1) + (F_1 + F_0)) + ((F_1 + F_0) + F_1) \\ F_5 &= (((F_1 + F_0) + F_1) + (F_1 + F_0)) + ((F_1 + F_0) + F_1) \\ F_5 &= (((1 + 0) + 1) + (1 + 0)) + ((1 + 0) + 1) \\ F_5 &= 5 \\ \\ \text{export function fib(n: } \underline{\text{number}}) : \underline{\text{number}} \; \{ \\ \text{ if } (n == 0 \mid \mid n == 1) \; \{ \\ \text{ return n} \\ \} \\ \text{ return fib(n - 1) + fib(n - 2)} \} \end{split}
```
